

Name: Fitri Cahyaniati

Class : SIB2G

ID : 2341760198

Exercise :

- **For A studies case with a minimum of 3 classes that are interconnected associate .**
- **Create at least 1 attribute type ArrayList of objects**
- **Determine attributes and methods in each class**
- **Draw the class diagram .**

Studies Case : System Management Garden Plant

I. Description :

System This used For manage garden plant with monitor and maintain plant in a way efficient . There is three main classes : Garden , Plant , and Worker . Garden Class containing information about garden and plant list as well as workers , class Plants containing information about plants , and Worker class containing information about worker a caring garden plant .

Class 1: Garden

- **Attributes :**
 - GardenName : String – Garden name
 - location : String – Garden location
 - PlantList : ArrayList < Plants > – List of plants in the garden
 - listWorkers : ArrayList < Workers > – List of workers garden
- **Method:**
 - addPlants (Plants) plants) : Add plant new to garden
 - addWorker (Worker) workers) : Add worker new to garden
 - assignWorkersToPlants (Plants) Plants , Workers worker) : Assign worker For nurse plant certain

Class 2: Plants

- **Attributes :**
 - PlantName : String – Plant name
 - Plant type : String – Type plants (example : " Tomato ", " Kangkung ")

- HealthStatus : String – Health status plants (example : " Healthy ", " Need Maintenance ")
- workers : Workers – Workers who are responsible answer For nurse plant
- **Method:**
 - updateHealthStatus (String status) : Updates the health status plant
 - setWorker (Worker workers) : Determine care worker plant

Class 3: Workers

- **Attributes :**
 - WorkerName : String – Worker name
 - idWorker : String – Worker ID
 - PlantList : ArrayList < Plants > – List of plants cared for by the worker
- **Method:**
 - addPlants (Plants plants) : Add plant to the list of plants cared for
 - deletePlants (Plants plants) : Delete plant from the list of plants cared for

II. Class Diagram :

- Garden class :

Garden
- GardenName : String - location : String - PlantList : ArrayList < Plants > - list of workers : ArrayList < Workers >
+ addPlant () + addWorker () + assignWorkersToPlants ()

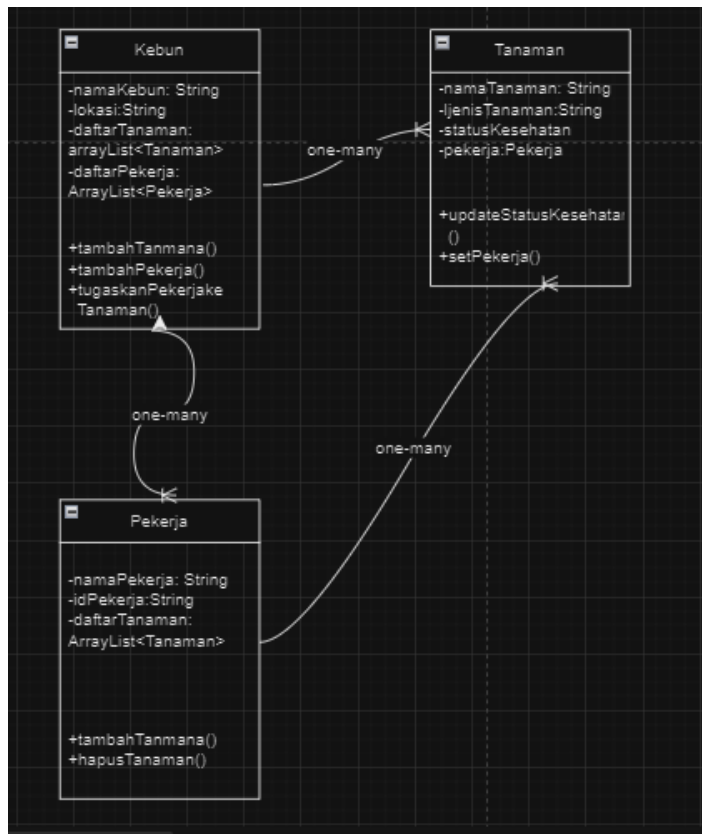

- Plant Class :

Plant
- PlantName : String - Plant type : String - HealthStatus : String - worker : Worker
+ updateHealthStatus () + setWorker ()

- Worker Class :

Worker
- WorkerName : String - idWorker : String - PlantList : ArrayList < Plants >
+ addPlant () + deletePlant ()

- **+** (**Public**) : Method / attribute Can accessed from outside class .
- **-** (**Private**) : Method / attribute only Can accessed from in class .

III. Relationship :

- Garden -> Plants :
 Notation : *1.. (One-to- Many) **
 Every Garden Can own Lots Plants , but every Plant only owned by one Garden .
 Garden : 1 Plant : 0.. *
- Garden -> Workers :
 Notation : *1.. (One-to- Many) **
 Every Garden can own Lots Workers , but every Worker only work in one Garden .
 Garden : 1 Workers : 0.. *
- Workers -> Plants :
 Notation : *1.. (One-to- Many) **
 Every Worker Can nurse Lots Plants , but every Plant cared for by one Worker .
 Workers : 1 Plants : 0.. *

IV. There is four type relation base between classes : Inheritance , Association , Aggregation , and Composition . Here is explanation and application:

a. Inheritance (Inheritance)

- Description : Inheritance used when a class take properties and behavior from other classes .
- Example on the system garden : For example , if We own class Workers are a superclass, we can has subclasses such as Permanent Workers and Casual Workers , where both inherit attributes and methods from Worker .

b. Association (Association)

- Description : Association is relation between object , where one class relate with class other without There is ownership exclusive .
- Example on the system garden : garden associate with Plants and Workers . This Because garden have a list of plants and workers , but No in a way exclusive " own " objects the .

c. Aggregation (Aggregation)

- Description : Aggregation is more relationships loose compared to composition , where one class " has " another class , but class owned can still exist without must depends on the class that owns it .
- Example on the system garden : garden aggregate Plants and Workers , meaning although Garden removed , Plants and Workers Still can There is in a way independent in context other .

d. Composition (Composition)

- Description : Composition is connection more ownership strong , where if the object that " has " is deleted , then owned objects are also deleted .
- Example on the system garden : If Plants own part or internal elements , such as Root or Leaves , composition can used . If the Plant deleted , then parts this is also deleted .

V. Code Program :
a. Kebun

```
Welcome  J Kebun11.java 1 X  J Tanaman11.java 1  J Pekerja11.java 1  J Main11.java

J Kebun11.java > ...
1  import java.util.ArrayList;
2
3  public class Kebun11 {
4      private String namaKebun;
5      private String lokasi;
6      private ArrayList<Tanaman11> daftarTanaman;
7      private ArrayList<Pekerja11> daftarPekerja;

43
```

e. Output

```
Messages' '-cp' 'C:\Users\HP\AppData\Roaming\Code\User\workspac
Daftar tanaman di kebun Kebun Sayur:
Tomat dirawat oleh: Budi
Kangkung dirawat oleh: Siti

Status kesehatan Tomat: Sehat
Status kesehatan Tomat setelah diperbarui: Butuh Perawatan
Budi merawat tanaman berikut:
- Tomat
Siti merawat tanaman berikut:
- Kangkung
PS D:\SEMESTER 3\PBO\Java\Jobsheet04\Perkebunan> █
```

List of plants in the garden: The program displays each plant in the garden and the workers who are caring for it.

Plant health status: Health status of the Tomato plants before and after being updated (default)

List of plants cared for by workers: Displays the plants being cared for by Budi and Siti
